

Track A: R-squared vs confidence

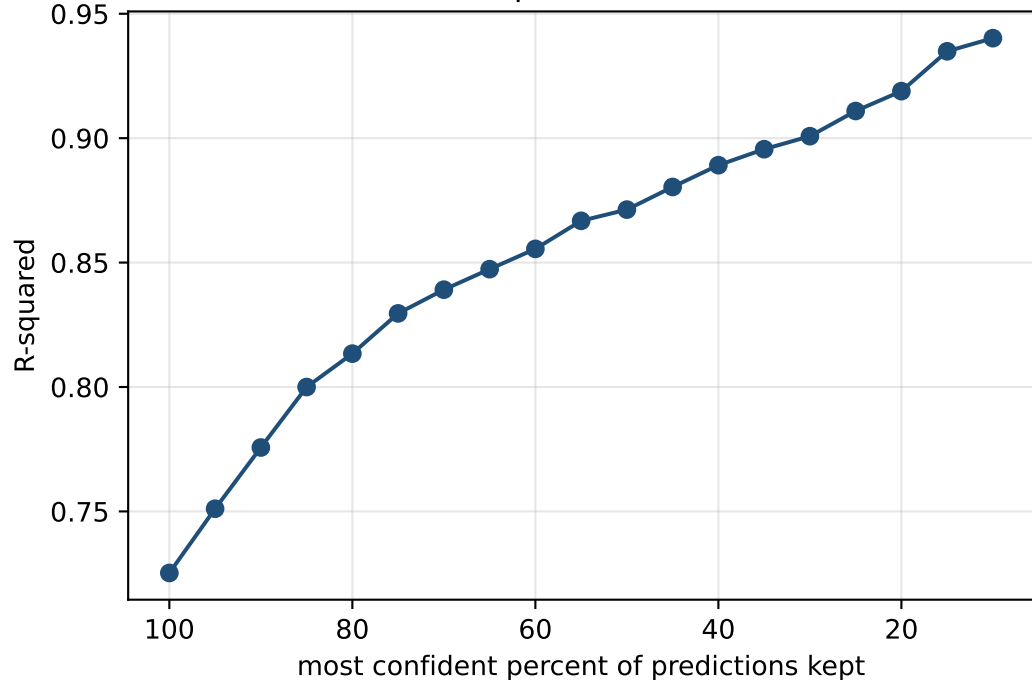

Track A: RMSE vs confidence

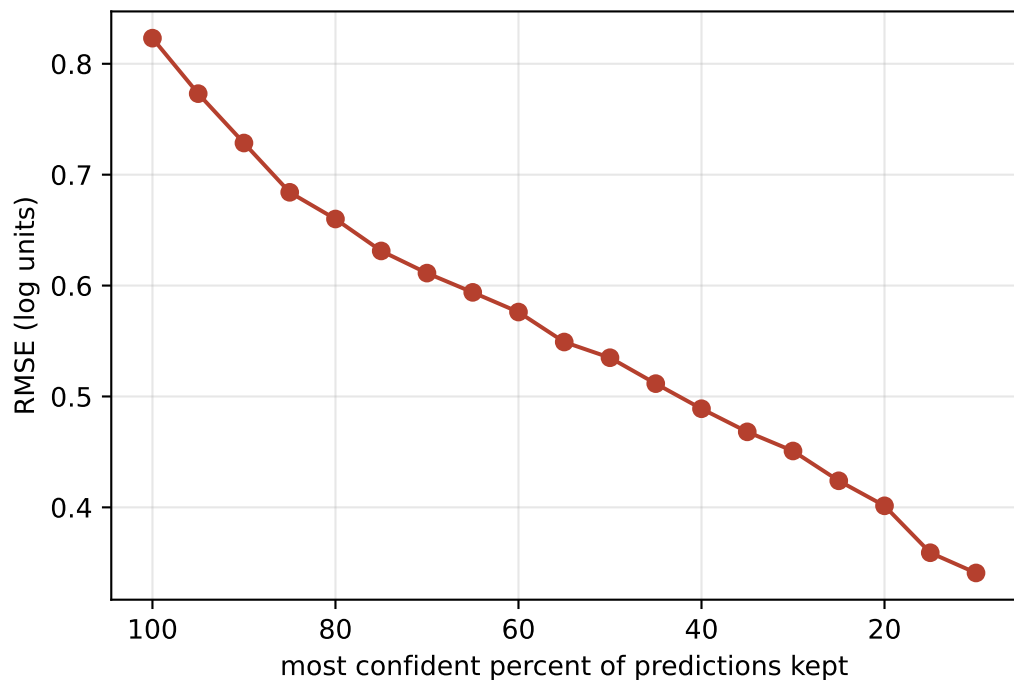

Track A: predicted vs actual
 $R^2=0.466$ RMSE=1.148

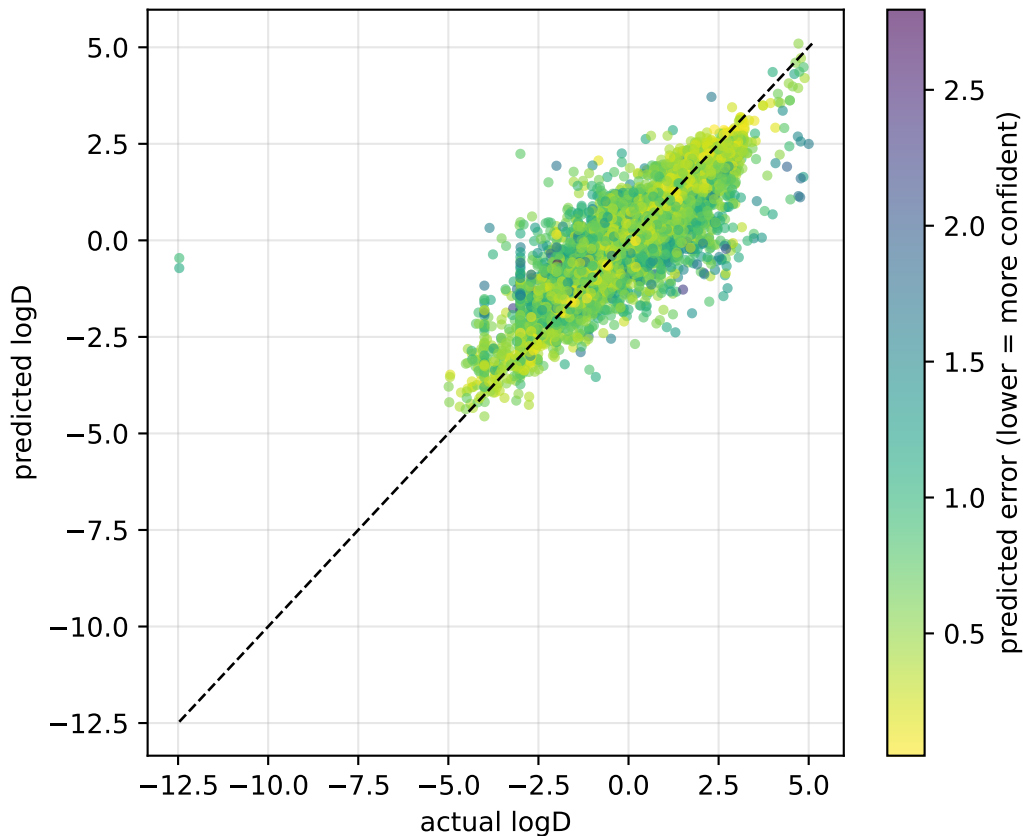

Track B: R-squared vs confidence

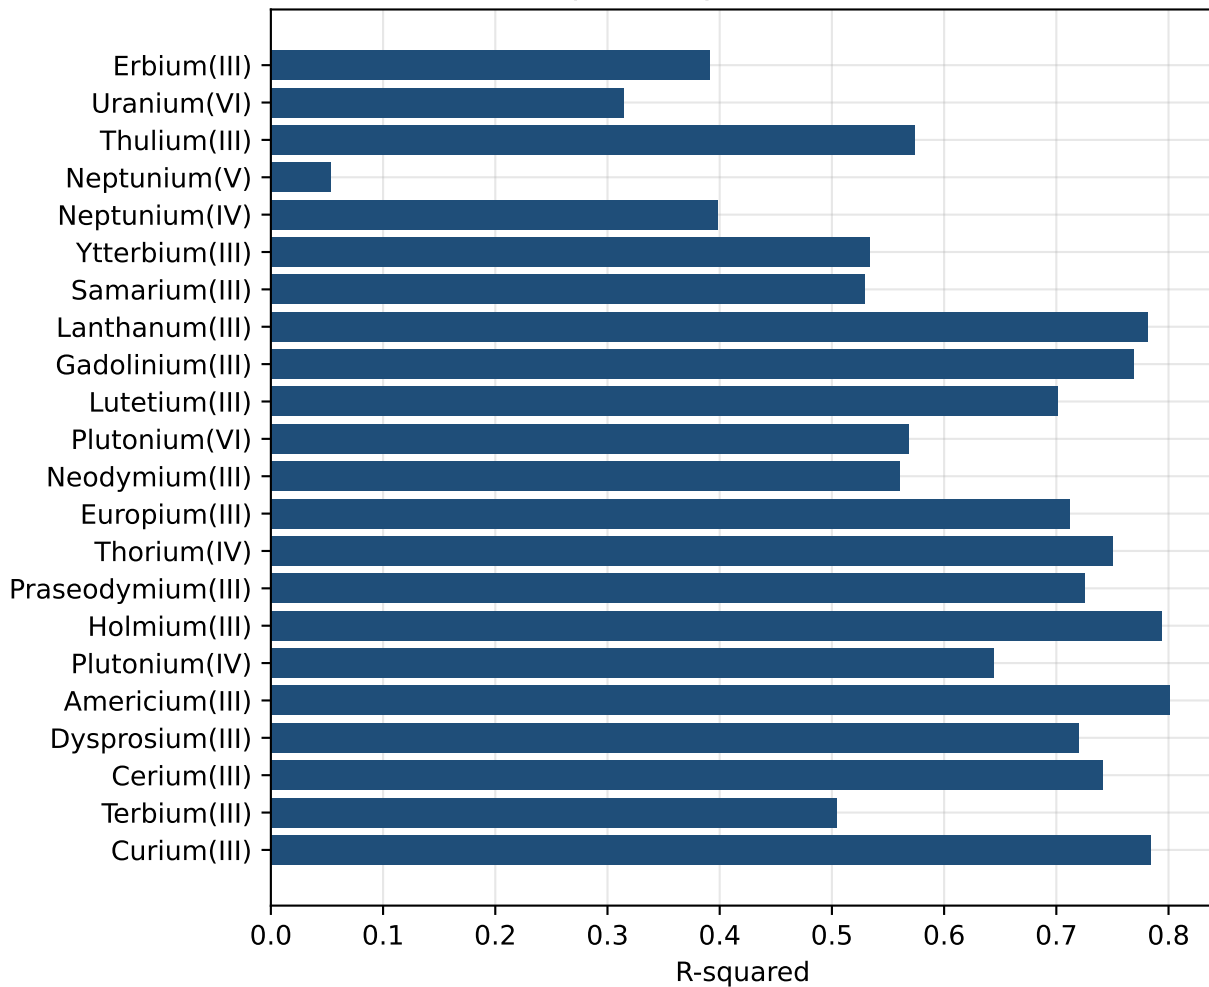

Track B: RMSE vs confidence

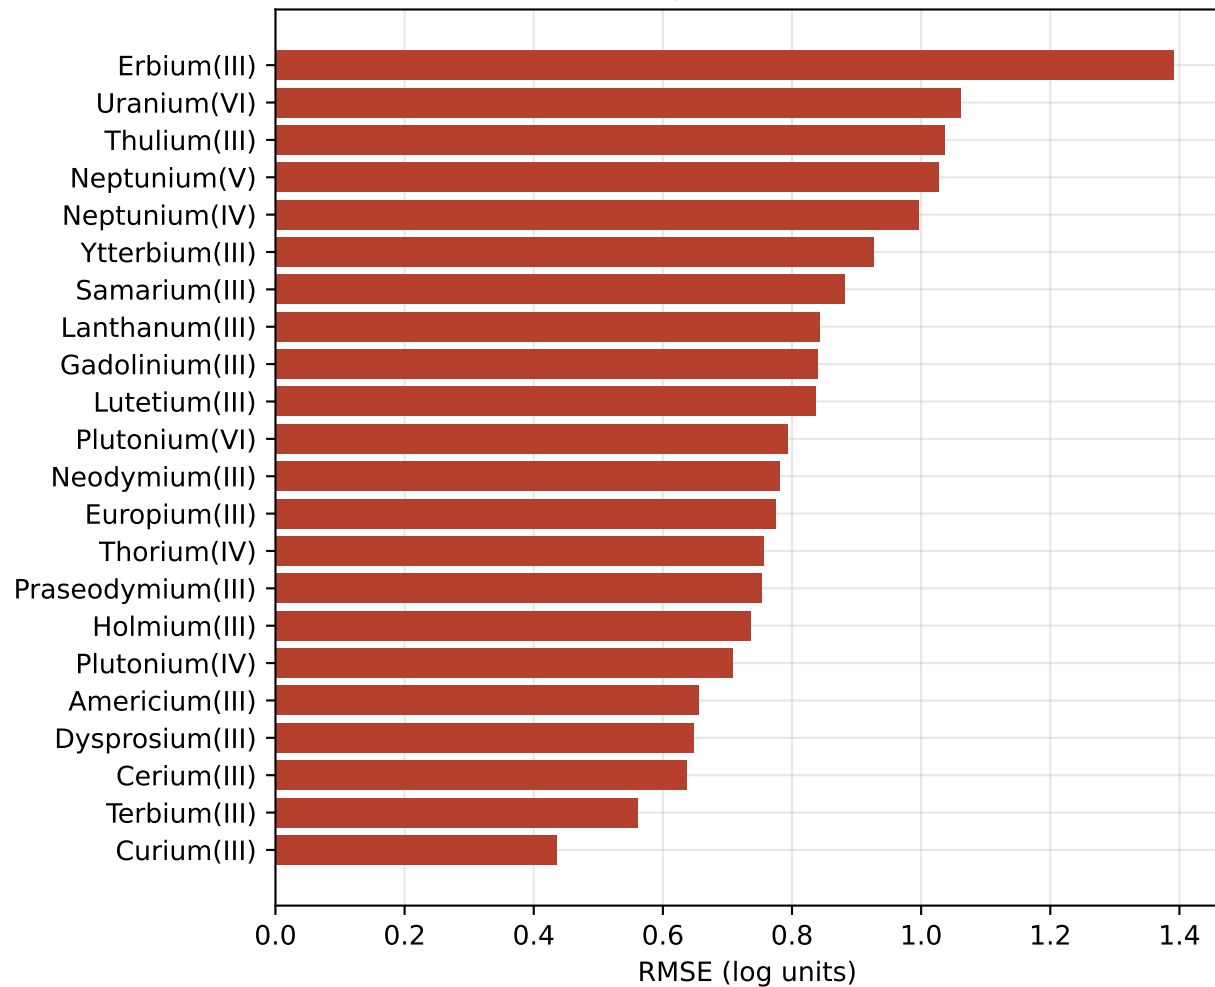

Track B: predicted vs actual
 $R^2=0.725$ RMSE=0.823

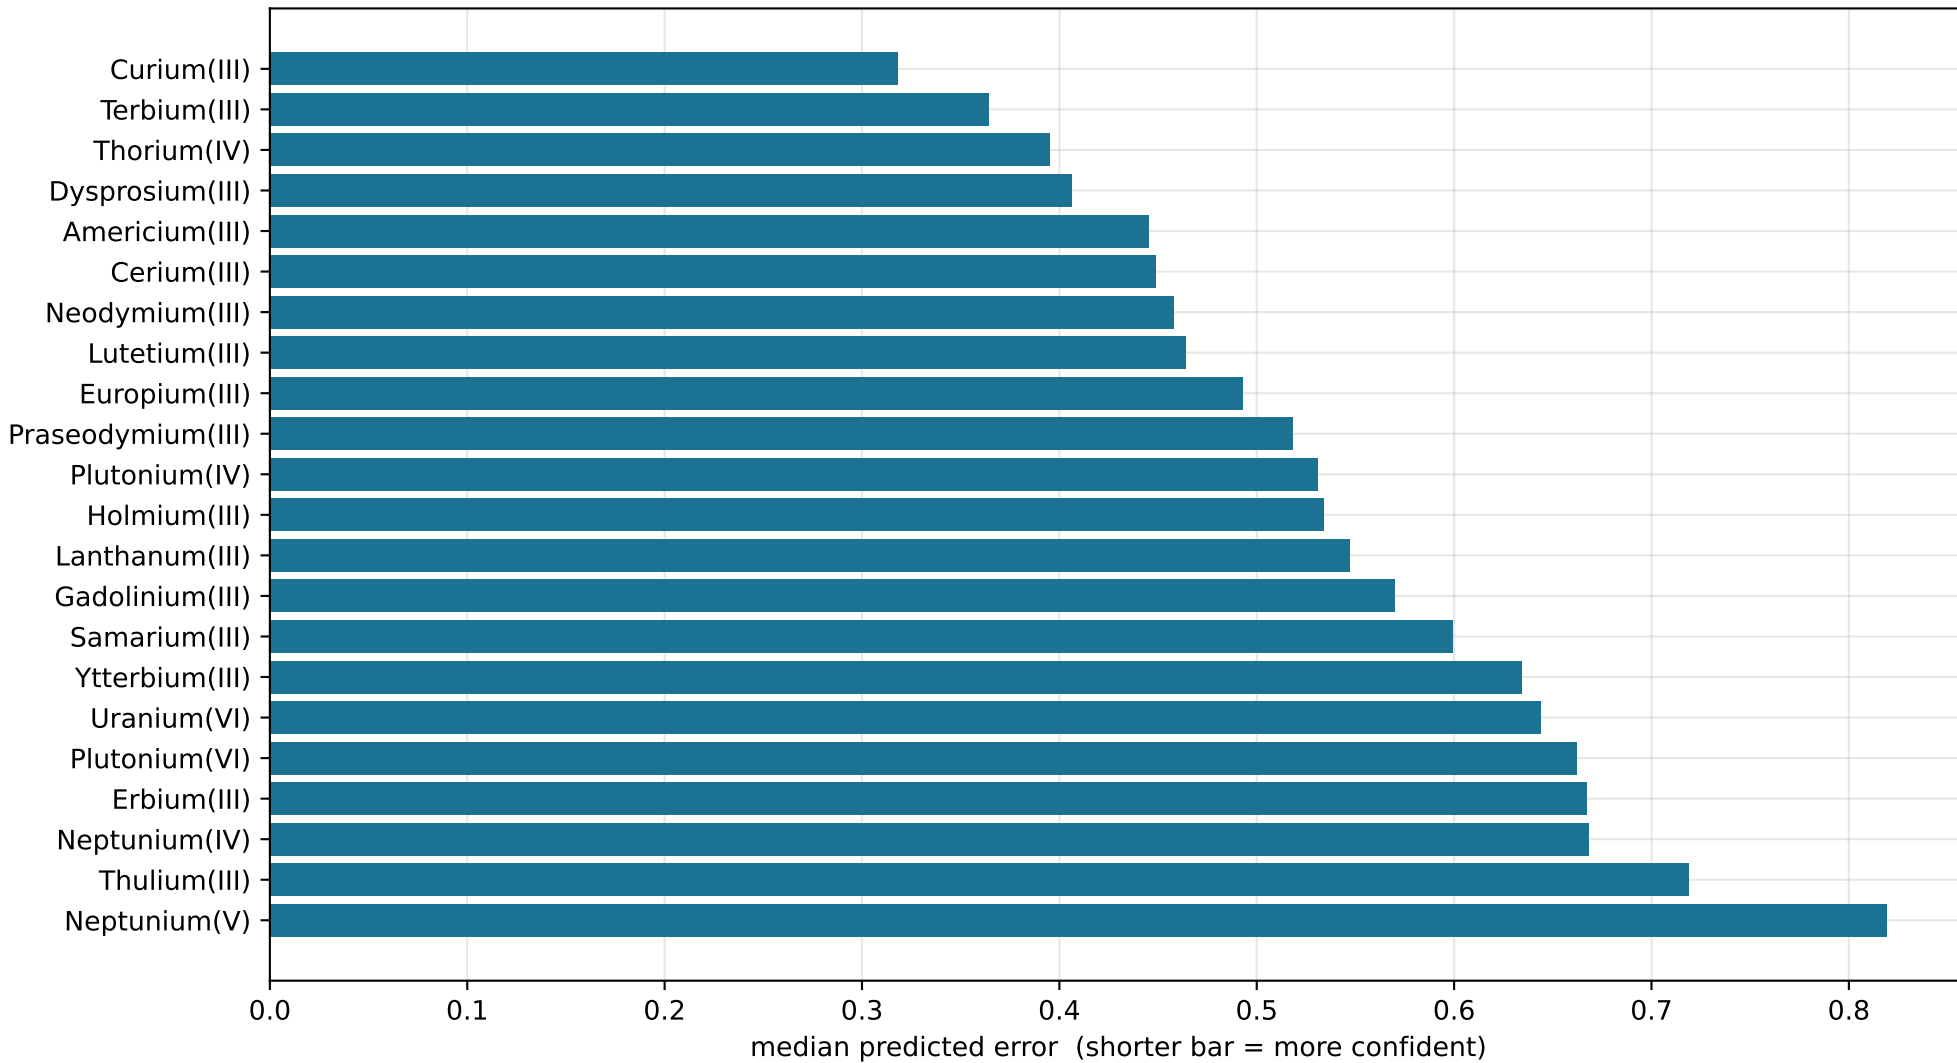

R-squared by metal (Track B)

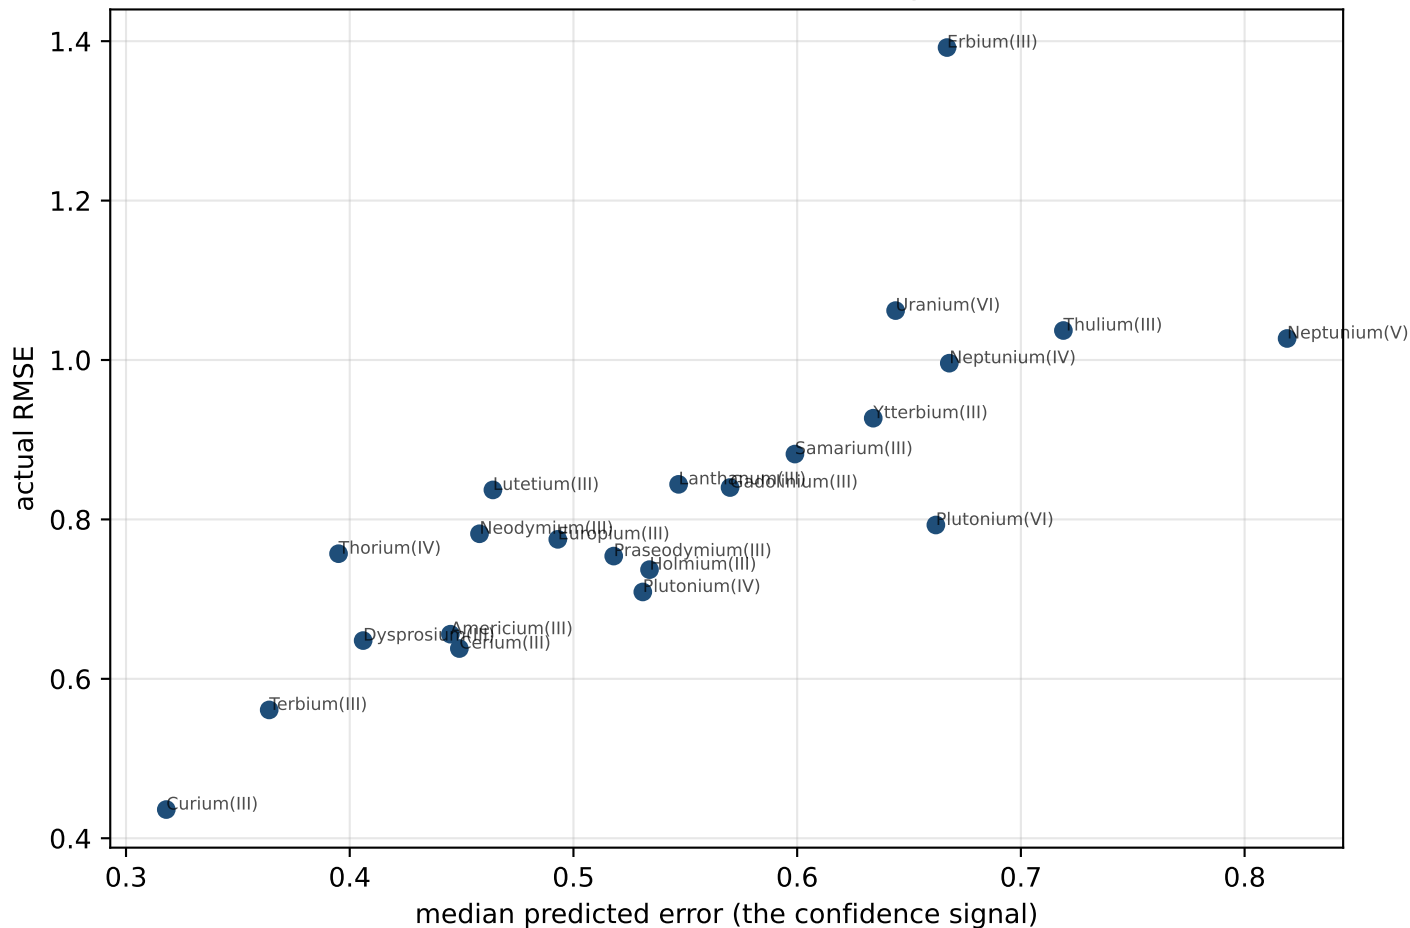

RMSE by metal (Track B)

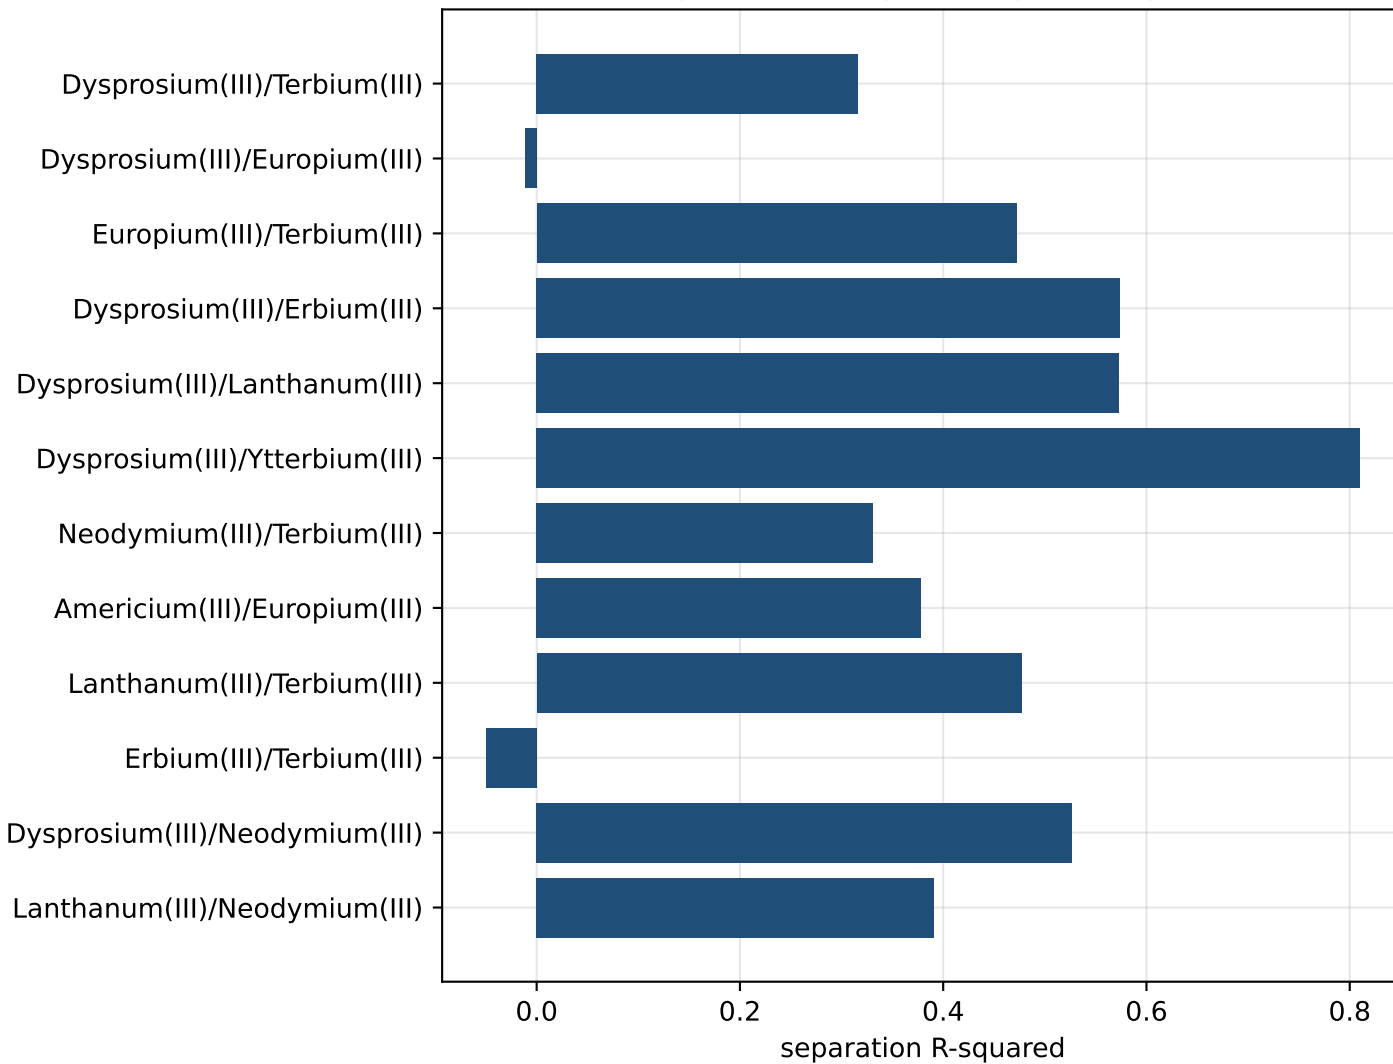

Confidence per metal (Track B)

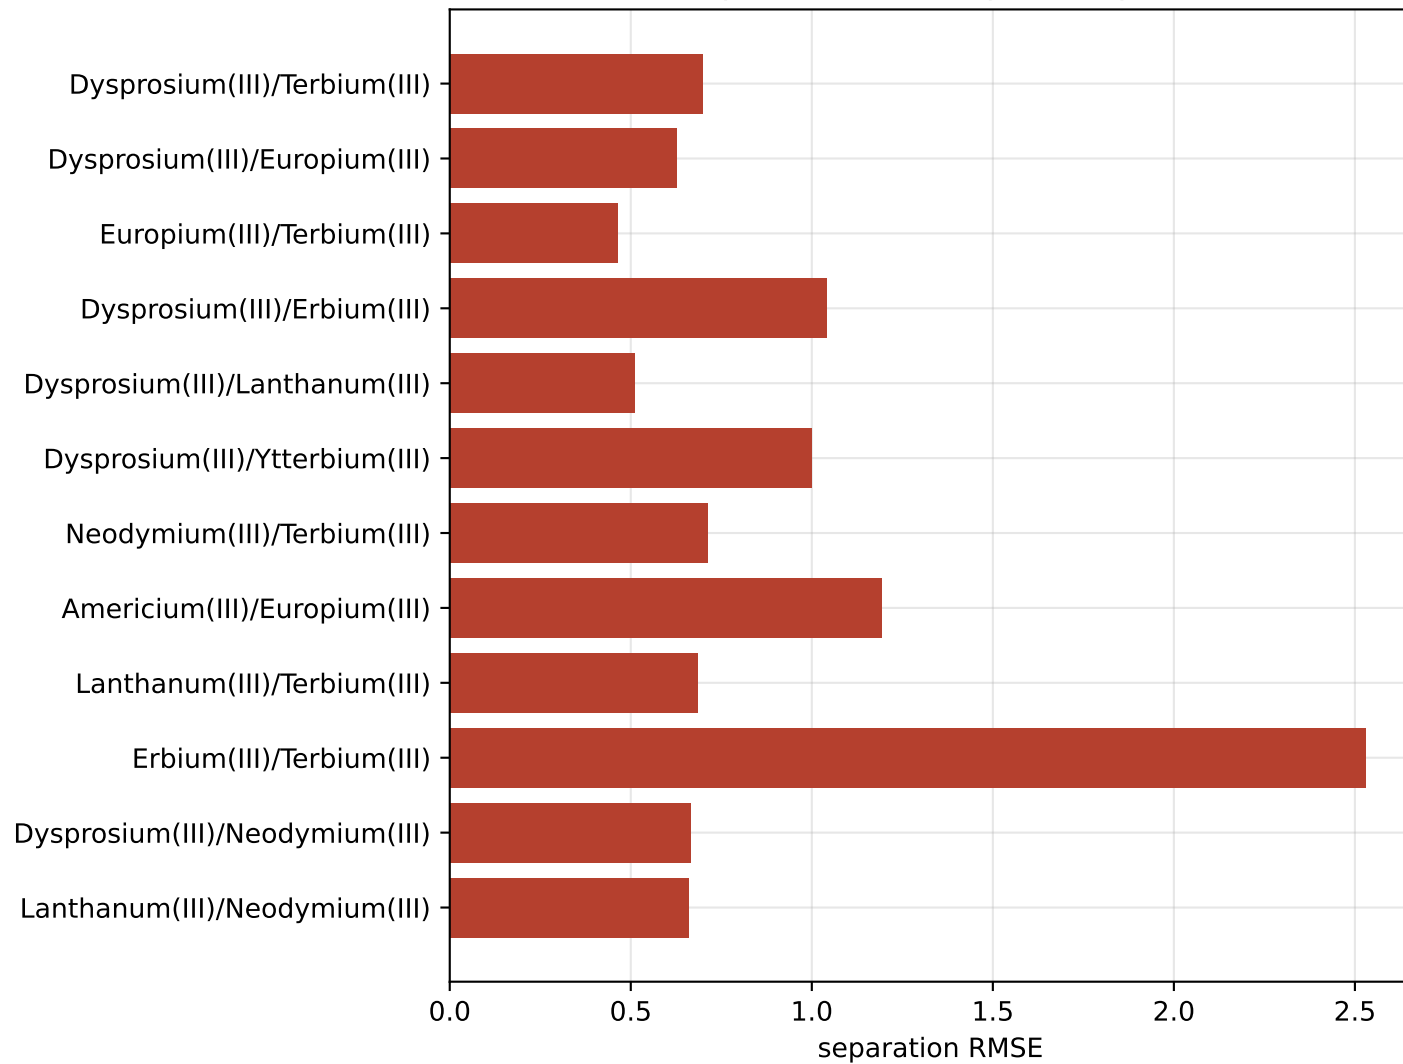

Confidence tracks real error, by metal

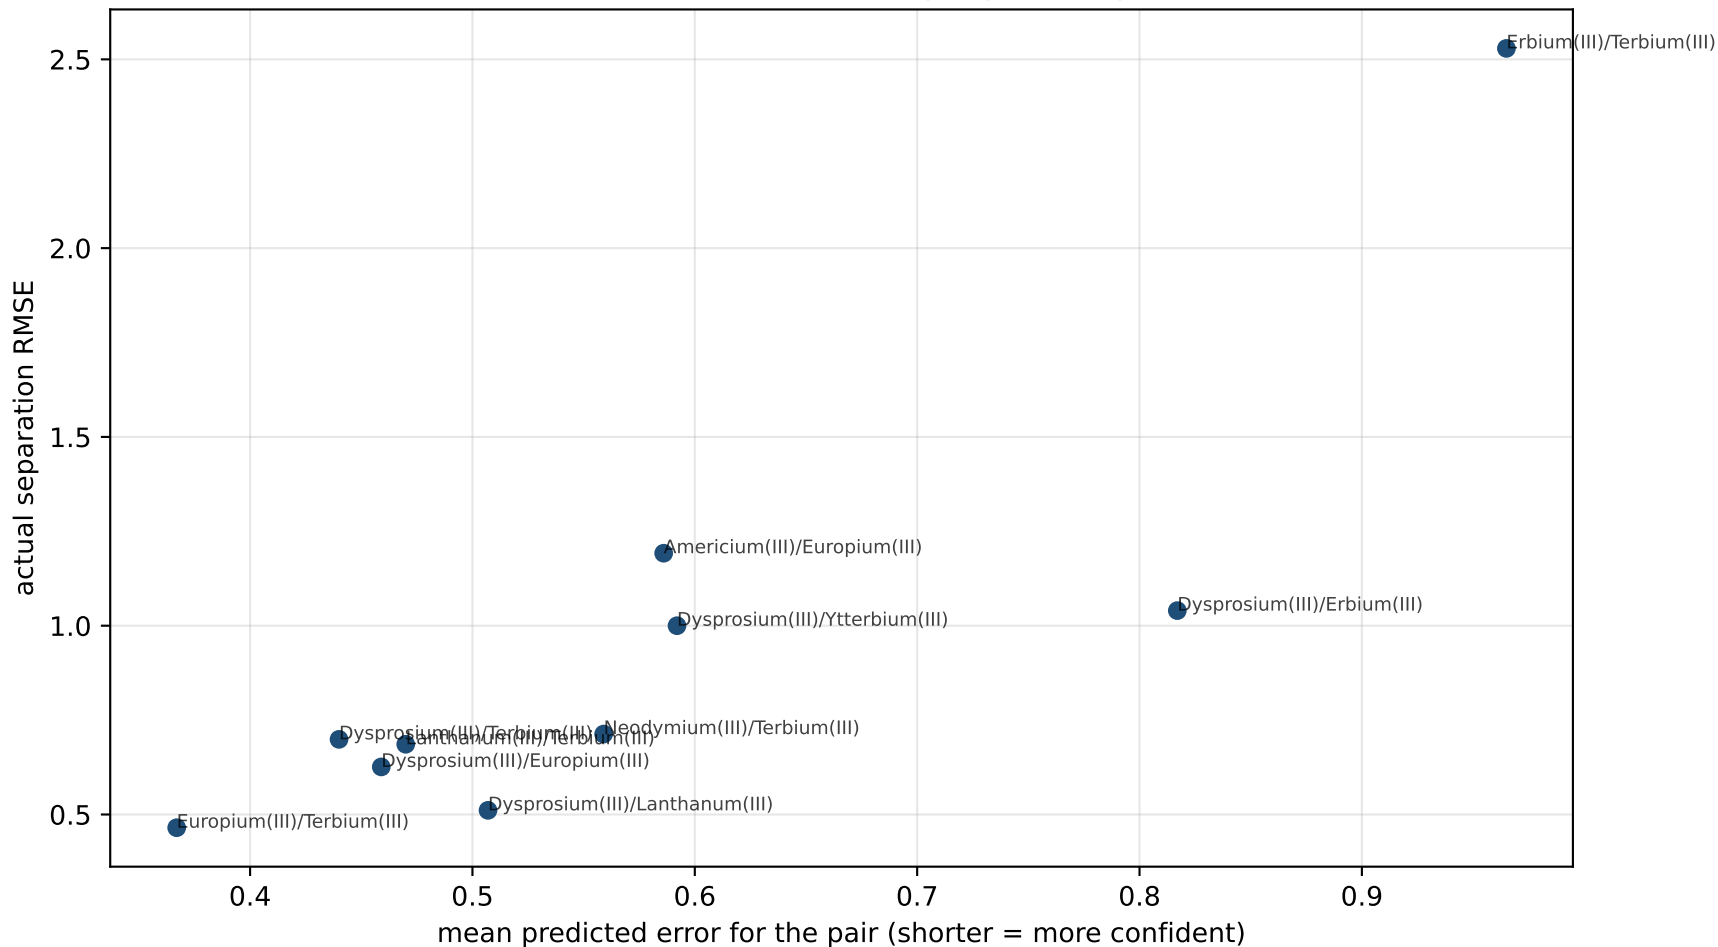

Separation R-squared by metal pair

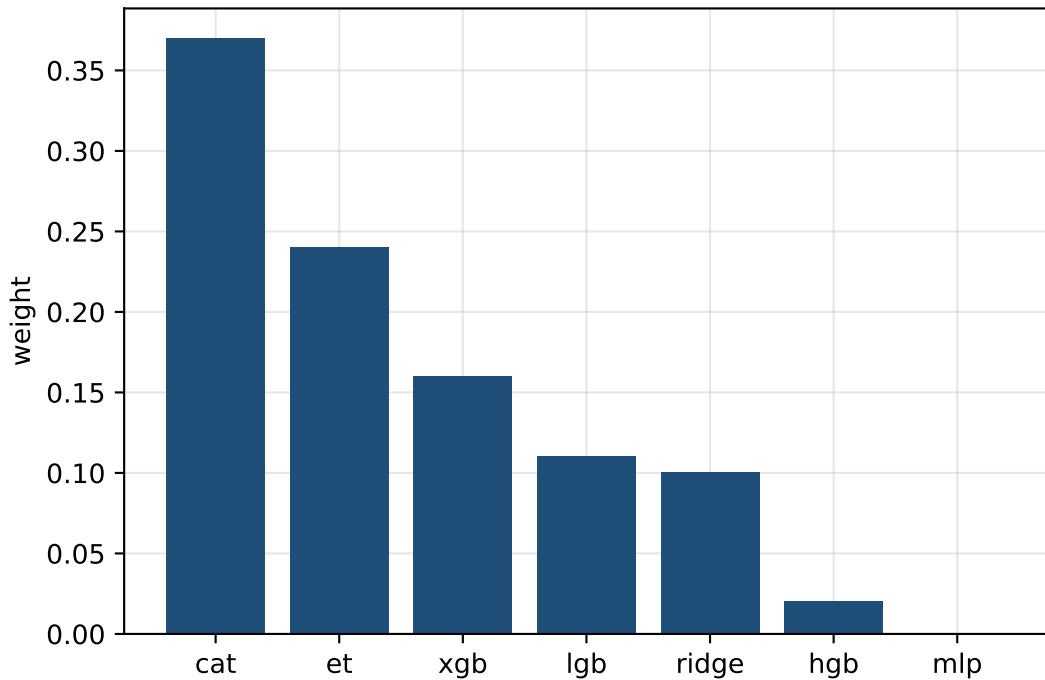

Separation RMSE by metal pair

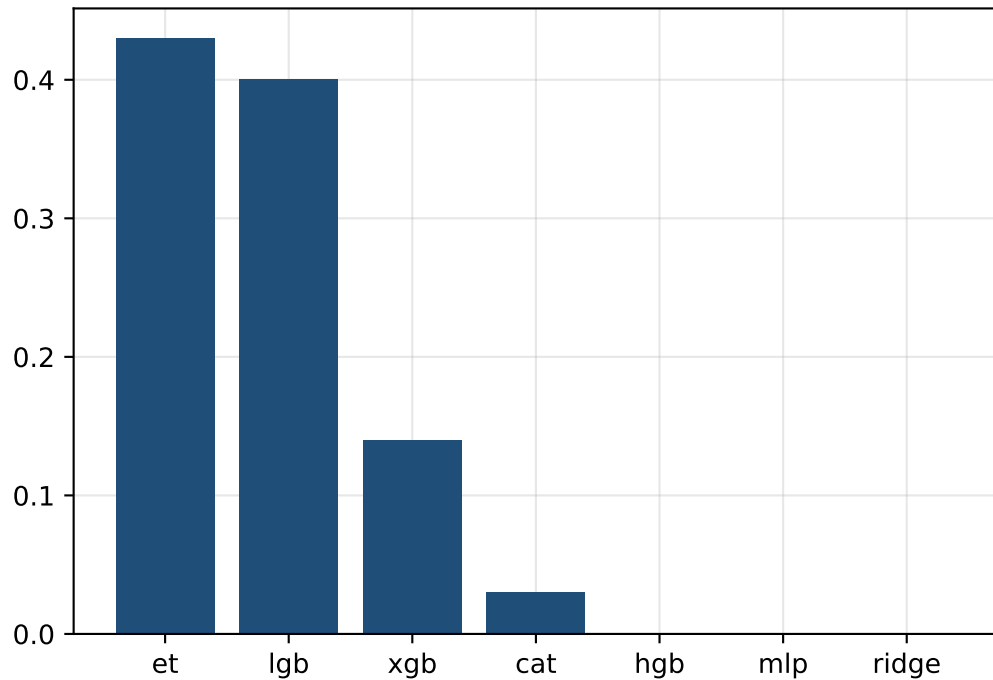

Confidence tracks difficulty, by metal pair

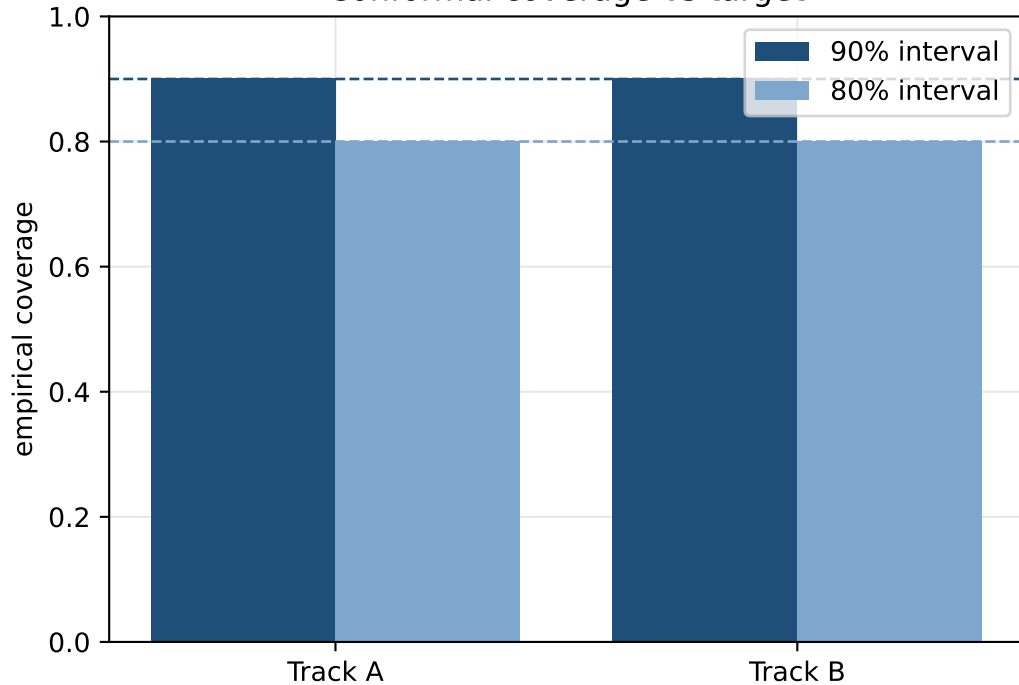

Track A stack weights (NNLS)

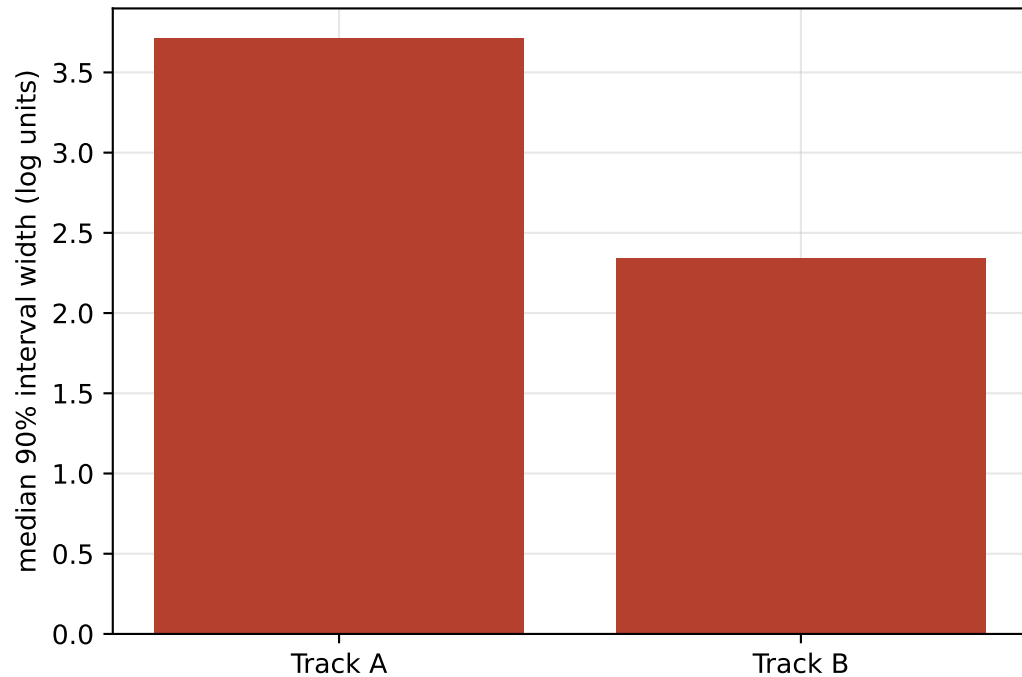

Track B stack weights (NNLS)

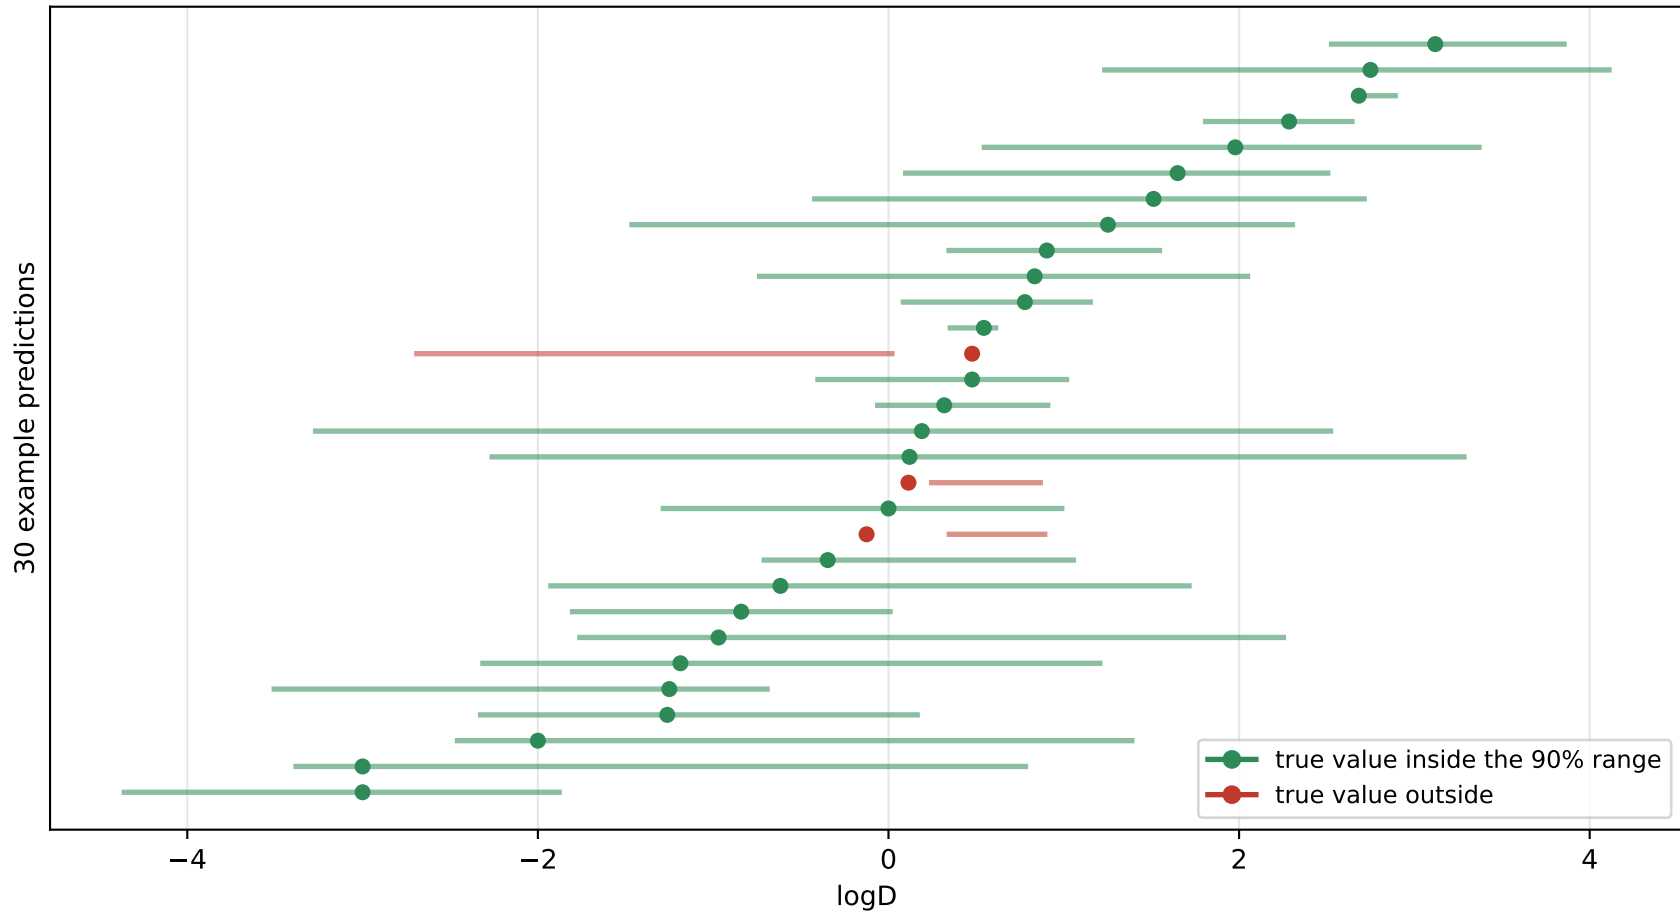

Conformal coverage vs target

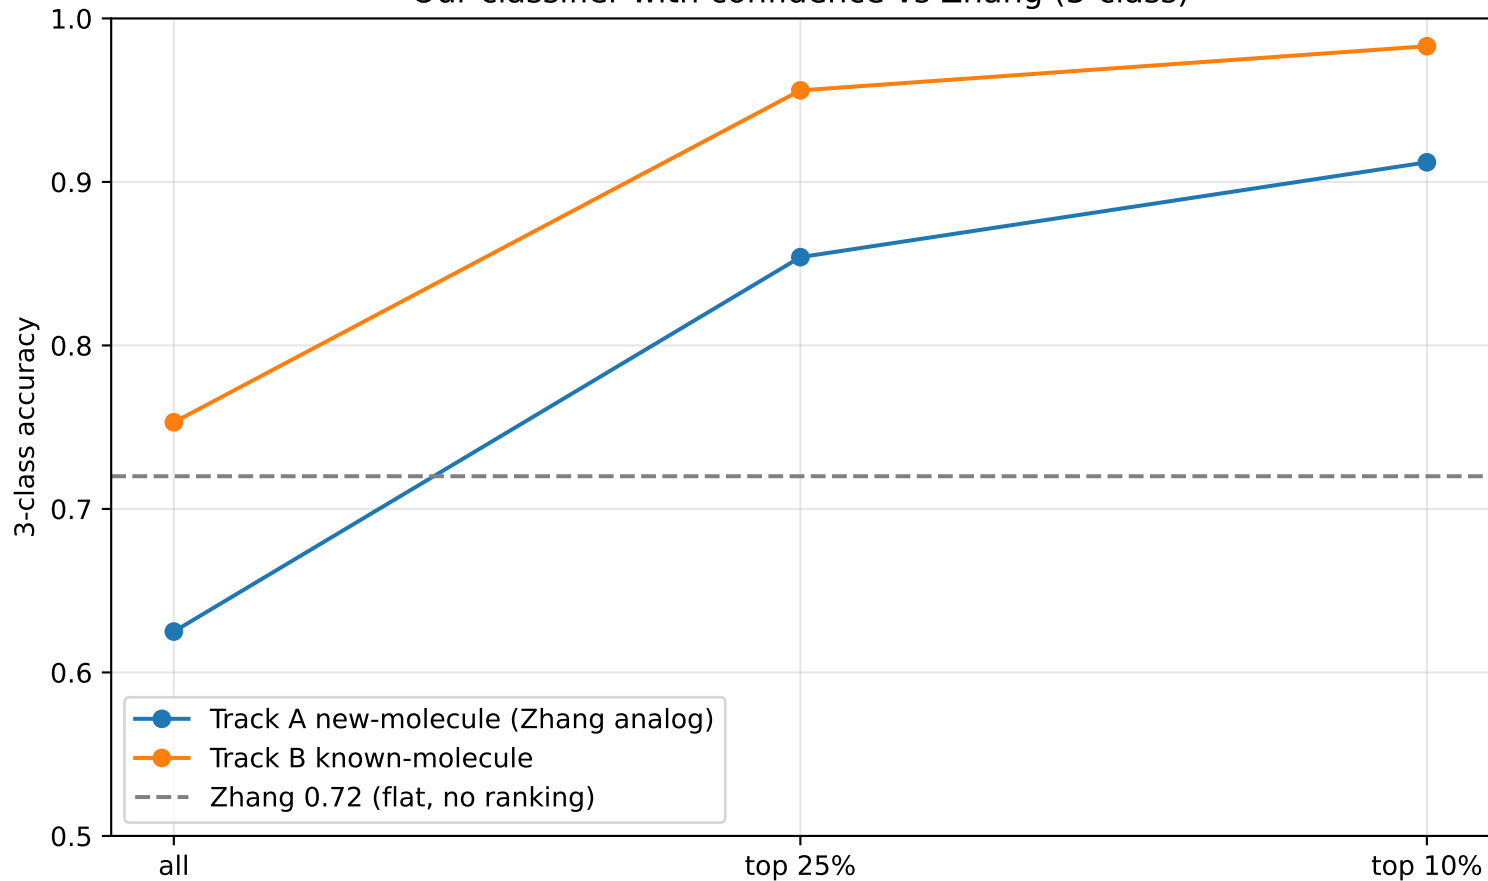

Interval width

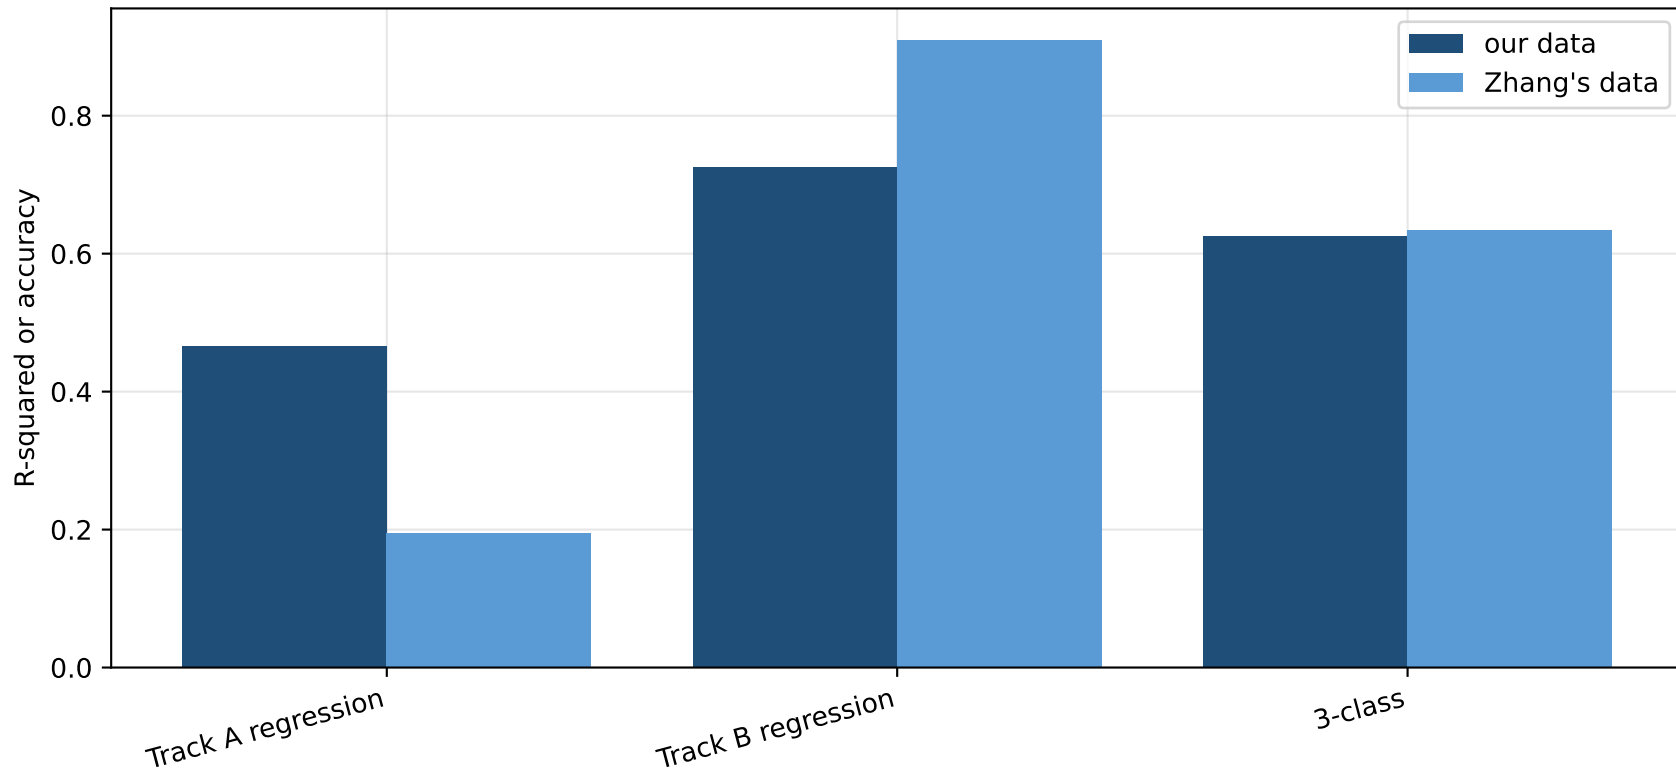

Each line is a prediction's 90% range; the dot is the true value
27 of 30 land inside (90%), matching the 90% target

Our classifier with confidence vs Zhang (3-class)

Our model: our data vs Dr. Zhang data

Our model on Dr. Zhang's exact split and test
same data, same features, same 15 held-out molecules
